

Mozambique outdoor power supply

Overview

Why is Mozambique a major energy exporter?

Mozambique is a net exporter of energy to countries in the Southern African Power Pool (SAPP) – South Africa being the largest importer. The government view energy exports as a key driver of the Mozambican economy, having passed a new electricity law that simplifies permitting and encourages IPPs activities.

What are the different types of energy transformation in Mozambique?

One of the most important types of transformation for the energy system is the refining of crude oil into oil products, such as the fuels that power automobiles, ships and planes. No data for Mozambique for 2022. Another important form of transformation is the generation of electricity.

What is EDM doing in Mozambique?

EDM and Mozambique support the development of renewable energy projects, having launched public tenders for solar and wind projects, the country is also exploring battery storage solutions. The largest power generation plant in the country is the Cahora Bassa hydro dam, operated by the government owned Hidroeléctrica de Cahora Bassa (HCB).

When did independent power projects start in Mozambique?

The first Independent Power Projects (IPPs) in Mozambique came online in 2015. These projects have paved the way for future IPP negotiations and, more recently, the standardization of tendering documents. Given EDM's weak financial capabilities, future IPPs will continue to rely on development banks for financing.

Why is Mozambique partnering with EDF?

This consortium is being led by French company EDF. Mozambique has frequent power shortages mainly due to extreme weather events, forcing EDM

to resort to expensive emergency power solutions. This creates another opportunity for U.S. companies providing emergency and backup generation solutions.

What is Mozambique doing in 2022?

No data for Mozambique for 2022. Another important form of transformation is the generation of electricity. Thermal power plants generate electricity by harnessing the heat of burning fuels or nuclear reactions – during which up to half of their energy content is lost.
