

New wind power system price

Overview

How much do commercial wind turbines cost?

A utility-scale wind turbine costs between \$1.3 million to \$2.2 million per MW of installed nameplate capacity. Most commercial-scale turbines installed nowadays are 2 MW in capacity and cost between \$3 and \$4 million to install. How much does a 12 MW wind turbine cost?

The most powerful 12 MW wind turbine costs up to \$400 million to manufacture and install. Costs for utility-scale wind turbines can be broken down into three categories: manufacturing, transport and installation, and operations and maintenance.

How much does a wind farm cost?

The location of a wind farm can have a profound effect on cost. While a wind turbine in Europe or the United States can cost about \$1 million per MW, turbines installed in countries like Brazil can be as cheap as \$500,000 per MW. Once the turbines are erected, they must be wired to the electrical grid.

How much does a wind turbine cost?

Smaller turbines that create roughly 2,000 kWh (kilowatt hours) per year cost between \$2,000 and \$8,000; however, acquiring and installing larger units can cost \$27,000 or more, although these models produce more power: around 9,000 kWh per year.

How much does an offshore wind turbine cost?

Large offshore turbines can cost tens of millions of dollars, with the most powerful 12 MW turbines reaching up to \$400 million (≈ 12820.5 years of non-stop work at \$15/hour - exceeding the time since the end of the last Ice Age) for manufacturing and installation.

How much does a wind turbine cost in 2024?

In 2024, the average capital cost for onshore turbines ranges between \$900 and \$1,200 per kilowatt (kW), while offshore turbines can cost between \$2,000 and \$3,000 per kW due to their complexity and installation challenges. Installation costs are influenced by site-specific conditions such as terrain, grid connection, and logistical considerations.

How much does a 15 kW wind turbine cost?

A larger 15 kW system can cost over \$100,000 and can produce about 36,000 kW per year. The largest free-standing wind systems can produce up to 100 kW, and are usually used for commercial use. Turbines of this size can power a school or small building.
